My name is Badru Michael Oluwarotimi, a graduate of Botany from Lagos State University, Nigeria (Class of 2023). My academic path has always revolved around one core curiosity: to bridge the chasm between the scientific and the spiritual in understanding life, consciousness, and the energetic nature of existence. This pursuit led me to found Spiritualectics, an emerging interdisciplinary school of thought that fuses empirical analysis with metaphysical insight. I am now seeking advanced academic training in Interdisciplinary Science and Consciousness Studies in Germany, where rigorous scholarship and cross-field integration are not only welcomed but actively nurtured.

Spiritualectics is more than a philosophical idea—it is a system of models, doctrines, and equations that attempt to quantify the unseen. At the core of my work is the Terminal Manner Doctrine (TMD), which proposes that while the moment of death may be immutable, the manner of death is determined by the most dominant energetic domain—spiritual, behavioral, natural, or predisposed—active at the time. I operationalized this using the Quantifiable Energy-Aura Scale (QEAS), a scoring framework that analyzes intensity and frequency across life domains to predict energetic dominance. The theory draws upon bio-energetics, psychology, metaphysics, and cultural anthropology—making it fundamentally interdisciplinary in both design and application.

In parallel, I authored a philosophical correction to classical moral theory titled “Free Will Is a Myth Without Capacity,” where I introduced the Constraint Law of Expressive Will. This model demonstrates that free will is not equally distributed, but constrained by one’s capacity to act—biologically, environmentally, or psychologically. These two models published on OSF Preprints and Zenodo (DOI: <https://doi.org/10.5281/zenodo.15331038>), have already begun to spark interest across digital academic platforms.

Germany represents to me a bastion of rigorous scientific inquiry and philosophical legacy. From the transcendental logic of Kant to the neuroscientific advances of modern institutions like the Max Planck Institutes, I believe Germany offers the ideal intellectual ecosystem to deepen, formalize, and expand my work under structured academic mentorship. I aim to collaborate with scholars working in fields such as cognitive neuroscience, consciousness studies, philosophy of science, and systems biology to refine my models and develop interdisciplinary tools for analyzing human behavior, fate, and energy interaction.

My long-term vision is to establish a global institute dedicated to energetic consciousness research, where scientists, philosophers, and spiritualists can collaborate toward a unified theory of life and mind. I also plan to publish a multilingual series of works that introduce Spiritualectics to both the scientific and public communities across the globe.

This application represents more than a pursuit of higher education—it is an evolutionary step in my life's work. I am confident that Germany’s academic environment, combined with my originality, persistence, and clarity of purpose, will result in research that not only breaks new ground but also helps bridge ancient mysteries with scientific understanding.

Thank you for considering my application.
